Vanguard® Cruciate Retaining (CR) Knee Design Features

Introduction

The proven clinical heritage of AGC®, Maxim®, and Ascent™ Total Knee Systems1–3 and combined state-of-the-art design features have allowed Zimmer Biomet to produce the most comprehensive total knee replacement system on the market. The Vanguard Knee System offers the flexibility to change from cruciate retaining (CR) to posterior stabilized (PS) within a single system. The transition between each constraint level can be made with ease, allowing the physician to evaluate soft tissue and bone deficiencies intraoperatively without making a preoperative commitment to the level of constraint. The Vanguard Knee is supported by five instrumentation platforms: Microplasty®, Premier ™, Microplasty® Elite, Vanguard Tensor, and Premier™ Anterior Referencing Systems, accommodating a number of workflows and techniques.

Advanced Technology

The Vanguard Complete Knee System continues to advance total knee arthroplasty with innovative technologies to provide personalized patient care. These technologies include:

• E1® Antioxidant Infused Bearing Technology
• Regenerex® Porous Titanium Construct
• Signature™ Personalized Patient Care

E1 Antioxidant Infused Bearing Technology

E1 Antioxidant Infused Tibial Bearing Technology defines a new class of bearings and overcomes the limitations of remelted and annealed polyethylenes by uniting true oxidative stability, high mechanical strength, and ultra-low wear4,5 (Figure 1).

See pages 9-10 for more information regarding E1 Tibial Bearings.

Regenerex Porous Titanium Construct

Regenerex Porous Titanium Construct unites the proven clinical history of titanium alloy6 with an enhanced interconnecting pore structure, resulting in a revolutionary material that provides for biologic fixation4,7 (Figure 2).

See page 12 for more information regarding Regenerex material.

Signature Personalized Patient Care

Signature Personalized Patient Care utilizes MRI and CT based patient-specific femoral and tibial positioning guides to offer an individualized approach to total knee replacement. The Signature System, which fits the femoral and tibial components independently, when used with the Vanguard Complete Knee System, offers a comprehensive solution for personalized patient care (Figure 3).

See page 16 for more information regarding the Signature System.
Femoral Design Features

When designing the Vanguard Complete Knee System, every aspect of the femur, tibia, and patella was reviewed for potential performance enhancements in all patient populations. Many clinically successful features found in earlier Zimmer Biomet Total Knee Systems can be found in the Vanguard Complete Knee System. However, many unique features were added.

The Vanguard Femoral Component has four main design features:

- Rounded sagittal profile
- Deeper, swept-back trochlear groove
- Wider proximal trochlear groove
- Sizing

Rounded Sagittal Profile

Two distinct femoral designs have evolved over time (Figure 4):

- Anatomic (box-like) femoral profile
- Swept-back (rounder) femoral profile

A round sagittal profile, as found in the Vanguard Knee, allows for greater range of motion than anatomic femoral components and may be more forgiving to the retinaculum by not over tensioning the soft tissues.8

Deeper/Swept-back Trochlear Groove

The trochlear groove is a critical design feature for patella performance. Translation of the trochlear groove posteriorly in the femur has shown to resist patella crepitus and clunk.9

The Vanguard trochlear groove has been designed to sweep back posteriorly for better patellar performance10 (Figure 5).

Wider Proximal Trochlear Groove

Patellar capture during flexion must be balanced with the need for less patellar constraint in extension. The trochlear floor of the Vanguard Knee has been widened to reduce the constraining forces in extension. The patella track provides a 6.5 degree valgus angulation and a 2 mm lateralized trochlear groove. “Valgus angulation has been shown to reduce the patellar shear stresses.”8

The wider proximal trochlear groove offers excellent patellar tracking (within 0 to 15 degrees of valgus) regardless of the patient’s Q-angle4 (Figure 6).
Sizing

The Vanguard Complete Knee System offers ten femoral sizes specifically designed for optimal bone coverage of all patient populations.

- Femoral sizes increase A/P by an average of 2.4 mm and M/L by 2.6 mm across all ten sizes (Figure 7)
- Narrow anterior flange maintains a small profile to reduce the likelihood of femoral overhang
- Rounded anterior flange corners to further address femoral overhang
- Posterior condyles grow proportionally in size to reduce overstuffing of the flexion gap in smaller femurs and the potential for undersizing the posterior condyles in larger femurs

Better coverage of the posterior condyles aids in achieving high flexion and restoring femoral offset. The posterior condyle geometry has also been optimized to provide larger contact areas in deep flexion to dissipate forces on the bearing more effectively.11

Removable Femoral Lugs/Augments

The Vanguard CR Femoral Lugs are removable and can be used in conjunction with distal augmentations (Figures 8 and 9). This feature allows for posterior and distal augmentation in a primary total knee arthroplasty or the use of a primary component in the revision of a unicompartmental knee arthroplasty.
Articulation Features

The Vanguard Complete Knee System features optimized tibiofemoral articulation based on the enhanced design of the following elements:

- Coronal Geometry
- Sagittal Geometry
- Curved Articulation

Coronal Geometry

The Vanguard Complete Knee System provides a fully congruent (coronally), moderately dished articulation to reduce polyethylene stresses, while still allowing physiological motion. The 1:1 condylar geometry provides surgical flexibility by allowing complete tibial-femoral interchangeability* (Figure 10).

Sagittal Geometry

The Vanguard Knee has been designed to allow up to 145 degrees of flexion without additional posterior condyle resections (Figure 12), with early results showing postoperative mean range of motion of 125 degrees at three year follow-up.4

The coronal geometry features softened intercondylar M/L edges. This radius enhancement provides increased contact area when the patella articulates on the condyles in flexion. A Finite Element Analysis has demonstrated a 25 percent reduction in patella contact pressure compared to the Maxim® Total Knee (Figure 11).

*with the exception of the Vanguard Anterior Stabilized (AS) Bearing
The Vanguard Tibial Bearings have a deep anterior relief to accommodate the patella tendon during high flexion (Figure 13).

**Curved Articulation**

To increase contact area with axial rotation, the Vanguard Knee features a rotated articulation bearing surface (Figure 14). As compared to a linear articulation, a rotated articulation increases the contact area by 13 percent.4

**CR Bearing Options**

Vanguard CR Tibial Bearings are available in both, ArCom® Direct Compression Molded Polyethylene and E1 Antioxidant Infused Technology. Three bearing design options are available for use with the CR knee (Figure 15).

- Standard CR
- CR Lipped
- Anterior Stabilized (AS)

These options provide intraoperative flexibility to meet patient needs and surgeon preference.

CR Bearing Options
Bearing Technologies
Zimmer Biomet’s proven polyethylene clinical heritage and commitment to improving bearing technologies to address the effects of oxidation, has produced some of the industry’s most advanced bearing technologies. These technologies include:

- ArCom Polyethylene
- E1 Antioxidant Infused Technology

ArCom Polyethylene
Oxidation negatively impacts the mechanical properties of polyethylene by causing pitting and delamination in knee bearing surfaces. Following Zimmer Biomet’s traditional engineering approach, it was the first company to use inert gas (argon) to replace oxygen during the sterilization and packaging process. The use of argon reduces the degradative effects of oxygen in polyethylene bearings. Furthermore, gamma sterilization in an argon atmosphere has been shown to decrease wear over EtO sterilized polyethylene by 44 percent (Figure 16).

Zimmer Biomet has continued the commitment to Direct Compression Molded (DCM) tibial bearings within the Vanguard Complete Knee System to minimize the potential for oxidative breakdown of the polyethylene. Zimmer Biomet’s ability to provide a clinically proven polyethylene along with a clinically proven method of consolidation for the Vanguard Complete Knee System punctuates Zimmer Biomet’s commitment to long term clinical success with its bearing technologies. DCM polyethylene has been clinically proven to be resistant to wear, delamination and oxidation with 97.8 percent survivorship reported at 20 years, with no implants being revised for polyethylene wear.

E1 Antioxidant Infused Technology
E1 Antioxidant Infused Tibial Bearing Technology defines a new class of bearings and overcomes the limitations of remelted and annealed polyethylenes by uniting true oxidative stability, high mechanical strength, and ultra-low wear. The foundation of this advancement in bearing technologies is ArCom Polyethylene.
E1 Antioxidant Infused Bearings are neither annealed nor remelted. Instead, oxidative stability is achieved by the infusion of Vitamin-E. Environmental Stress Crack Testing (ESC) mimics cyclic loading in vivo which is a major reason or mode for bearing breakdown. ESC testing has shown E1 material to be more oxidatively stable than sequentially crosslinked and annealed polyethylene (Figure 17). This manufacturing process allows E1 material to achieve oxidative stability without remelting the bearing material, which ultimately allows the bearing to retain its mechanical strength (Figure 18).

An internal Zimmer Biomet study demonstrated that CR E1 tibial bearings had an 86 percent reduction in wear over CR DCM tibial bearings (Figure 19).

E1 Antioxidant Infused Technology FDA Cleared Claims:
- Prevents oxidative degradation of polyethylene
- Protects polyethylene from oxidation and cracking during environmental stress crack testing
- Maintains the mechanical strength of conventional UHMWPE under small punch testing
- Maintains mechanical strength after accelerated aging
Polyethylene Thickness

Meding, et al. demonstrated excellent long-term results with 4.4 mm minimum thickness DCM tibial bearings. The Vanguard Complete Knee System provides a minimum of 6 mm of polyethylene thickness in all components (Figure 20).

Component Fixation

The Vanguard Complete Knee System incorporates three types of fixation:

- Interlok Finish
- PPS® Porous Plasma Spray Coating
- Regenerex Porous Titanium Construct

Interlok Finish

The Interlok Finish allows for proper cement interdigitation into the surface for a more secure bond in cemented applications (Figure 21).

PPS Porous Plasma Spray Coating

Since its introduction in 1981, Zimmer Biomet’s PPS® Coating has been used by surgeons throughout the world to achieve better fixation on a multitude of products including the AGC®, Maxim®, and Ascent™ Knee Systems. Long-term follow-up studies show that surgeons are observing extremely low rates of osteolysis and 97 percent survivorship at 20 years with PPS® coated prostheses (Figure 22).

In addition, PPS Coating has been proven to:

- Provide for more biologic fixation than CoCr material and has proven superior with regard to biocompatibility and component fit over titanium fiber mesh
- Maintain the implant’s inherent fatigue strength
- Provide early stage fixation, helping to prevent micromotion
- Provide late stage fixation, helping to offload stresses between implant and bone
Regenerex Porous Titanium Construct

Regenerex Porous Titanium Construct unites the proven clinical history of titanium alloy with an enhanced interconnecting pore structure, resulting in a revolutionary material that provides for biologic fixation (Figure 23).

Regenerex material provides for:

- Average porosity of 67 percent
- Average pore size of 300 microns
- High strength and flexibility
- Fixation in as early as two weeks was reported in canine studies

The large potential surface area for biologic fixation makes this tray an optimal option for patients with good bone quality.

Tibial Tray Design Features

Concerns have been raised about modularity and bearing micromotion as a contributor to osteolysis and early failure. Feng, et al. have found that the most severe polyethylene wear occurs at the periphery, where the tibial component had a raised metal edge. These concerns have been addressed with the Zimmer Biomet modular tibial tray design.

The modular design of the Vanguard Tibial Tray is based on clinically successful features of earlier Zimmer Biomet Total Knee Systems, including:

- Locking Mechanism
- Sizing
- Tibial Baseplate Options
- Stem Options

Locking Mechanism

Effective polyethylene thickness is determined by evaluating not only thickness at the center of the tibial condyle but also by measuring the periphery of the polyethylene insert. Many competitive components provide adequate thickness at the center, but compromise thickness around the edges due to the design of the locking mechanism.

Features of the locking mechanism design include (Figure 24):

- Peripheral polyethylene thickness is maintained by locating the locking mechanism anteriorly and within the intercondylar area
- Vanguard’s Locking Mechanism compresses the polyethylene bearing against the tray by utilizing an oversized titanium locking bar that forces the bearing against a 10 degree posterior boss
- The Coventry Award-winning study by Parks and Engh, and a study published by Sosa, have shown the Vanguard Locking Mechanism to be “the most stable overall.”

Figure 23
Regenerex® Porous Titanium Technology

Figure 24
Anterior Compressive Locking Mechanism
Sizing

Many knee systems offer a variety of tibial tray sizes. However, few systems offer consistent sizing. Based on the work of Mensch and Amstutz, the Vanguard Knee System offers nine symmetrical tibial baseplates that change in consistent 4 mm M/L intervals (Figure 25).

<table>

Incavo, et al. examined eight tibial tray designs, consisting of six symmetrical and two asymmetrical baseplates. The study demonstrated that the sizing rationale for the AGC Total Knee System, which is closely paralleled by the Vanguard Knee System, offers optimal coverage as compared to competitive asymmetrical designs (Figure 26).

Of all the tibial trays tested in one study, the modular tray design of the AGC Knee was ranked as the best in total tibial plateau coverage, covering 81 percent of the tibial surface.

Tibial Baseplate Options

Primary tibial trays are made from both titanium and cobalt chrome alloys. Modular titanium primary baseplates are available with an Interlok Finish for cemented applications, or PPS Coating and Regenerex Porous Titanium Construct to enhance bone fixation in cementless applications.

PPS coated baseplates accept up to four 6.5 mm cancellous bone screws (Figure 27), while Regenerex® Baseplates feature four solid titanium pegs that exhibit a rough texture (Figure 28) for enhanced fixation when a cementless tibial component is utilized.
The Regenerex® Tibial Tray is compatible with four primary articulations within the Vanguard Complete Knee System:

- CR
- CR Lipped
- AS
- PS

The Vanguard Complete Knee System is compatible with the following cobalt chrome baseplate options: I-beam, cruciate finned, or Microplasty® Tray with an Interlok® Finish (Figure 29).

I-beam and cruciate finned baseplates feature a 40 mm stem design while the 20 mm cruciate stem design of the Microplasty Tibial Tray allows for a less invasive procedure and arcs posteriorly to increase resistance against pull-out.

Interlok Offset Tibial Baseplate, Interlok Stemmed Baseplate, and the PPS Baseplate can be used with block or wedge augments. All augments are fixed to the baseplates by bolts, allowing a mechanical lock between the tray and augments.

**Stem Options**

The modular titanium primary baseplate allows for intraoperative stem selection to match specific patient needs. An I-beam primary stem is available in 40 mm length, while cruciate fin and splined primary stems are available in 40 mm and 80 mm lengths. In addition to the 40 mm and 80 mm splined, and cruciate fin stems, a taper cap is available for the Regenerex Primary Tibial Tray (Figure 30).

The combination of a Morse-type taper and screw fixation helps maintain a solid connection between the stem and baseplate. When more fixation is desired, the stemmed or offset tray will accept a 40, 80, 120, 160, or 200 mm stem extension (Figure 31). Stem extensions are available in splined, smooth and grit-blasted finishes. Bowed, splined, smooth and grit-blasted stem extensions are offered in 160 and 180 mm lengths.
Patellar Articulation

The Vanguard Complete Knee System offers multiple patella options:

- Series A
  - Single Peg (1-Peg)
  - Three Peg (3-Peg)
- Regenerex Construct
  - Three Peg (3-Peg)

Series A Patella

Ritter, Lombardi, Insall, Ranawat, et al. have shown excellent long-term results with domed patellar designs.\textsuperscript{9,11,33,34} The domed patella is more forgiving in placement than other designs and can reliably provide congruent contact\textsuperscript{10} (Figure 32).

Regenerex Patella

The Regenerex Primary Three Peg Patella incorporates Zimmer Biomet’s Regenerex Porous Titanium Construct with the Series A true dome shape and the standard poly thickness. The octagonal pegs provide for initial fixation on the resurfaced bone (Figure 34).

Series A and Regenerex Patella size and thickness offering listed below (Figure 35):

**Signature™ Personalized Patient Care**

Signature Personalized Patient Care utilizes patient specific femoral and tibial positioning guides developed from MRI and CT imaging modality to offer an individualized approach to total knee replacement. The Signature System fits the femoral and tibial components independently. When used with the Vanguard Complete Knee System, it offers a comprehensive solution for personalized patient care. Features of the Signature System include:

- Signature Planning Landmarks
- Signature Total Knee Planning Software
- Signature Positioning Guides

**Signature Planning Landmarks**

The Signature System features proprietary planning algorithms to generate an initial preoperative plan incorporating traditional resection guides and allowing intraoperative position verification by the surgeon.

These landmarks include (Figure 36):

- A. Anterior/Posterior Axis
- B. Epicondylar Axis
- C. Distal Femoral Mechanical Axis
- D. Lateral Distal Femoral Condyle
- E. Medial Distal Femoral Condyle
- F. Posterior Condylar Axis
- G. Lateral Plateau
- H. Proximal Tibial Mechanical Axis Landmark
- I. Medial Plateau
- J. Medial One-third of the Tibial Tubercle

**Signature Total Knee Planning Software**

Software built into the Signature System allows surgeons to visualize and specify an implant position for each patient plan.

- Automated planning algorithms generate preoperative plan based off mechanical axis
- User-friendly software for surgeon fine-tuning
- Positioning guides incorporate preoperative surgeon alteration

The result of the preoperative surgical planning is a more focused intervention with the instruments required for surgery as well as the operative plan.
Signature Positioning Guides

Preoperative surgeon planning is integrated into Signature Positioning Guides (Figure 37).

Femoral positioning guides register on femoral bearing to establish:
- Distal femoral resection
- Distal femoral valgus angle
- Distal femoral flexion angle
- Femoral component rotation
- A/P position
- Femoral component sizing

Tibial positioning guides register on the anteromedial tibial plateau to establish:
- Tibial resection
- Varus/valgus angle
- Tibial slope angle
- Tibial rotation

Instrumentation Platforms

The Vanguard Complete Knee System is supported by five instrumentation platforms, allowing the physician to evaluate soft tissue and bone deficiencies intraoperatively without making a preoperative commitment to the level of constraint.

These instrumentation platforms include:
- Microplasty Instrumentation
- Premier™ Instrumentation
- Microplasty Elite Instrumentation
- Vanguard Tensor Instrumentation
- Premier Anterior Referencing Instrumentation

Microplasty Total Knee Instrumentation

Microplasty Total Knee Instrumentation is designed for use with minimally invasive surgical techniques and includes Zimmer Biomet’s Slidex Technology which allows for minimal disruption to soft tissues during total knee arthroplasty (Figure 38).

Figure 37
Signature Positioning Guides

Figure 38
Microplasty Total Knee Instrumentation
**Premier Total Knee Instrumentation**
Premier Total Knee Instrumentation is designed for conventional total knee replacement. Enhanced instrument functionality allows for reproducible and reliable results (Figure 39).

**Figure 39**
Premier Total Knee Instrumentation

---

**Microplasty Elite Total Knee Instrumentation**
Microplasty Elite Total Knee Instrumentation is designed for use with both traditional surgical methods as well as minimally invasive techniques. This instrumentation is designed for minimization of soft tissue trauma that occurs during total knee arthroplasty (Figure 40).

**Figure 40**
Microplasty Elite Total Knee Instrumentation

---

**Vanguard Tensor Instrumentation**
Utilizing Premier Total Knee Instrumentation, the Vanguard Tensor is designed to assist in balancing soft tissues during total knee arthroplasty (Figure 41).

**Figure 41**
Vanguard Tensor Instrumentation

---

**Premier Anterior Referencing Instrumentation**
Anterior Referencing Instrumentation is available for use with the Vanguard Complete Knee System. This instrumentation allows for anterior referencing during femoral preparation to accommodate the preferred approach of individual surgeons (Figure 42).

**Figure 42**
Premier Anterior Referencing Instrumentation
Vanguard PS Knee Design Features

Introduction
The proven clinical heritage of AGC, Maxim, and Ascent Total Knee Systems1–3 and combined state-of-the-art design features have allowed Zimmer Biomet to produce the most comprehensive total knee replacement system on the market. The Vanguard Knee System offers the flexibility to change from cruciate retaining (CR) to posterior stabilized (PS) within a single system. The transition between each constraint level can be made with ease, allowing the physician to evaluate soft tissue and bone deficiencies intraoperatively without making a preoperative commitment to the level of constraint. The Vanguard Knee is supported by five instrumentation platforms: Microplasty, Premier, Microplasty Elite, Vanguard Tensor, and Premier Anterior Referencing Systems, accommodating a number of workflows and techniques.

Advanced Technology
The Vanguard Complete Knee System continues to advance total knee arthroplasty with innovative technologies to provide personalized patient care. These technologies include:

- E1 Antioxidant Infused Bearing Technology
- Regenerex Porous Titanium Construct
- Signature Personalized Patient Care

E1 Antioxidant Infused Bearing Technology
E1 Antioxidant Infused Tibial Bearing Technology defines a new class of bearings and overcomes the limitations of remelted and annealed polyethylenes by uniting true oxidative stability, high mechanical strength, and ultra-low wear4,5 (Figure 43).

See page 26 for more information regarding E1 Tibial Bearings.

Regenerex Porous Titanium Construct
Regenerex Porous Titanium Construct unites the proven clinical history of titanium alloy6 with an enhanced interconnecting pore structure, resulting in a revolutionary material that provides for biologic fixation4,7 (Figure 44).

See pages 27–28 for more information regarding Regenerex material.

Signature Personalized Patient Care
Signature Personalized Patient Care utilizes MRI and CT based patient-specific femoral and tibial positioning guides to offer an individualized approach to total knee replacement. The Signature System, which fits the femoral and tibial components independently, when used with the Vanguard Complete Knee System, offers a comprehensive solution for personalized patient care (Figure 45).

See pages 31–32 for more information regarding the Signature System.
**Femoral Design Features**

When designing the Vanguard Complete Knee System, every aspect of the femur, patella, and tibia was reviewed for potential performance enhancement in all patient populations. Many clinically successful features found in earlier Zimmer Biomet Total Knee Systems can be found in the Vanguard Complete Knee System. However, many unique features were added.

The Vanguard femoral component has five main design features:

- Rounded sagittal profile
- Deeper/swept-back trochlear groove
- Extended trochlear groove
- Wider proximal trochlear groove
- Sizing

**Rounded Sagittal Profile**

Two distinct femoral designs have evolved over time (Figure 46).

- Anatomic (box-like) femoral profile
- Swept-back (rounder) femoral profile

A round sagittal profile, as found in the Vanguard Knee, allows for greater range of motion than anatomic femoral components and may be more forgiving to the retinaculum by not over tensioning the soft tissues.⁸

**Deeper/Swept-back Trochlear Groove**

The trochlear groove is a critical design feature for patella performance. Translation of the trochlear groove posteriorly in the femur has shown to resist patella crepitus and clunk.⁹

The Vanguard trochlear groove has been designed to sweep back posteriorly for better patellar performance.¹⁰

**Extended Trochlear Groove**

The trochlear groove has been lengthened to further support the patella in deep flexion and provide more support of the quadriceps tendon (Figure 47). The junction of the trochlear groove and PS box articulates with the quadriceps tendon at 105–120 degrees of flexion.

**Wider Proximal Trochlear Groove**

Patellar capture during flexion must be balanced with the need for less patellar constraint in extension. The trochlear floor of the Vanguard Knee has been widened to reduce the constraining forces in extension. The patella track provides a 6.5 degree valgus angulation and a 2 mm lateralized trochlear groove. “Valgus angulation has been shown to reduce the patellar shear stresses.”⁸
The wider proximal trochlear groove offers excellent patellar tracking (within 0–15 degrees of valgus) regardless of the patient’s Q-angle\(^4\) (Figure 48).

**Sizing**

The Vanguard Complete Knee System offers ten femoral sizes specifically designed for optimal bone coverage of all patient populations.

- Femoral sizes increase A/P by an average of 2.4 mm and M/L by 2.6 mm across all ten sizes (Figure 49)
- Narrow anterior flange maintains a small profile to reduce the likelihood of femoral overhang
- Rounded anterior flange corners to further address femoral overhang
- Posterior condyles grow proportionally in size to reduce overstuffing of the flexion gap in smaller femurs and the potential for undersizing the posterior condyles in larger femurs

Better coverage of the posterior condyles aids in achieving high flexion and restoring femoral offset. The posterior condyle geometry has also been optimized to provide larger contact areas in deep flexion to dissipate forces on the bearing more effectively.\(^{11}\)

**PS Femoral Box Design**

The Vanguard Complete Knee System offers a closed box and open box femoral component.

Vanguard Instrumentation offers three resections that accomodate both closed and open box femoral component designs (Figure 50). The closed box (CL) resection level is utilized when implanting a closed box femoral component. The open box femoral component can be implanted utilizing either the open box (OP) or the bone conserving (BC) resection level.
The open box design allows for additional preservation of distal bone. Utilizing the bone conserving resection with the open box design will conserve bone anteriorly while additional box resection is made for closed box design (Figure 51). If needed, IM nails can be utilized in the intercondylar notch with the open box femoral component.

**Extended Cam**

The Vanguard PS features an extended cam (Figure 52) for increased resistance to dislocation in deep flexion.

**Cam and Post Engagement**

The cam, of the Vanguard PS Femoral Component, is designed to engage the post of the tibial bearing at 45 degrees of flexion (Figure 53).

**Cam and Post Design**

The Vanguard PS Femoral Component has been specifically designed to enhance performance. Key elements in the Vanguard PS design include:

- Extended Cam
- Cam and Post Engagement
- Dislocation Height

Gait analysis demonstrates that the weight bearing phase occurs from 0–45 degrees. After weight bearing phase occurs, the cam engages the post to provide stability and increase quadriceps efficiency, specifically during activities such as ascending and descending stairs.

Mid-flexion cam engagement avoids cam and post contact during cycle activities but provides for stability during load activities.
**High Dislocation Height**

The cam engages relatively low on the tibial bearing post and remains low throughout full range of motion. The forces at the tibial bone interface and locking mechanism are decreased, while maintaining a high bearing dislocation height. The dislocation height of the Vanguard PS is never less than 17.3 mm at 90 degrees of flexion or greater (Figure 54). The Vanguard PS component allows for 10 degrees of hyperextension before anterior post impingement.

**Articulation Features**

The Vanguard Complete Knee System features optimized tibiofemoral articulation based on the enhanced design of the following elements:

- Coronal Geometry
- Sagittal Geometry
- Curved Articulation

**Coronal Geometry**

The Vanguard Complete Knee System provides a fully congruent (coronally), moderately dished articulation to reduce polyethylene stresses, while still allowing physiological motion. The 1:1 condylar geometry provides surgical flexibility by allowing complete tibiofemoral interchangeability* (Figure 55).

The coronal geometry features softened intercondylar M/L edges. This radius enhancement provides increased contact area when the patella articulates on the condyles in flexion. A finite element analysis has demonstrated a 25 percent reduction in patella contact pressure compared to a conventional total knee4 (Figure 56).

**Sagittal Geometry**

The Vanguard Knee has been designed to allow up to 145 degrees of flexion without additional posterior condyle resections (Figure 57), with early results showing postoperative mean range of motion of 125 degrees at three year follow-up.4

*with the exception of the Vanguard Anterior Stabilized (AS) Bearing
The Vanguard Tibial Bearings have a deep anterior relief to accommodate the patella tendon during high flexion (Figure 58).

Curved Articulation
To increase contact area with axial rotation, the Vanguard Knee features a rotated articulation bearing surface (Figure 59). As compared to a linear articulation, a rotated articulation increases the contact area by 13 percent.4

PS Bearing Options
Vanguard PS Tibial Bearings are available in both ArCom Direct Compression Molded Polyethylene and E1 Antioxidant Infused Technology.

Two bearing design options are available for use with the PS knee.
- PS
- PS Plus

PS Bearing Design
The Vanguard PS post geometry is rounded to minimize forces on the post due to femoral rotation (Figure 60). According to a mechanical wear simulation test, the Vanguard PS Bearing had a 71 percent reduction in gravimetric wear at 5.5 million cycles, as compared to standard square post design geometry.4
PS Plus Bearing Design

The prominent anterior lip of the PS Plus bearing helps resist paradoxical anterior femoral slide during gait (Figure 61). This cradling effect controls the femoral component on the articulating surface without sacrificing freedom of rotation. The combination of 45 degrees cam engagement with a prominent anterior lip limits premature wear of the tibial post and provides mid-flexion stability.

The PS Plus bearing is more constrained than the standard PS bearing (Figure 62). The PS Plus bearing is indicated for use in a primary situation when more stability and initial constraint is desired to resist rotation and varus/valgus lift-off. The PS Plus bearing limits rotation to +/-2 degrees and varus/valgus lift-off to 2 degrees. The standard PS bearing does not constrain the femur in rotation or varus/valgus lift-off.

Bearing Technologies

Zimmer Biomet’s proven polyethylene clinical heritage and commitment to improving bearing technologies to address the effects of oxidation, has produced some of the industry’s most advanced bearing technologies. These technologies include:

- ArCom Polyethylene
- E1 Antioxidant Infused Technology

ArCom Polyethylene

Oxidation negatively impacts the mechanical properties of polyethylene by causing pitting and delamination in knee bearing surfaces. Following Zimmer Biomet’s traditional engineering approach, it was the first company to use inert gas (argon) to replace oxygen during the sterilization and packaging process. The use of argon reduces the degradative effects of oxygen in polyethylene bearings.5 Furthermore, gamma sterilization in an argon atmosphere has been shown to decrease wear over EtO sterilized polyethylene by 44 percent12 (Figure 63).

Zimmer Biomet has continued the commitment to Direct Compression Molded (DCM) tibial bearings within the Vanguard Complete Knee System to minimize the potential for oxidative breakdown of the polyethylene. Zimmer Biomet’s ability to provide a clinically proven polyethylene13–17 along with a clinically proven method of consolidation for the Vanguard Complete Knee System punctuates Zimmer Biomet’s
commitment to long term clinical success with its bearing technologies. ArCom® Polyethylene has been clinically proven to be resistant to wear, delamination and oxidation with 97.8 percent survivorship reported at 20 years, with no implants being revised for polyethylene wear.¹

**E1 Antioxidant Infused Technology**

E1 Antioxidant Infused Tibial Bearing Technology defines a new class of bearings and overcomes the limitations of remelted and annealed polyethylenes by uniting true oxidative stability, high mechanical strength, and ultra-low wear.⁴ ⁵ The foundation of this advancement in bearing technologies is ArCom Polyethylene.

E1 Antioxidant Infused Bearings are neither annealed nor remelted. Instead, oxidative stability is achieved by the infusion of Vitamin-E. Zimmer Biomet Environmental Stress Crack Testing (ESC) mimics cyclic loading in vivo which is a major reason or mode for bearing breakdown. ESC testing has shown E1 material to be more oxidatively stable than sequentially crosslinked and annealed polyethylene⁴ (Figure 64). This manufacturing process allows E1 material to achieve oxidative stability without remelting the bearing material, which ultimately allows the bearing to retain its mechanical strength⁴ ⁵ (Figure 65).

A second, independent study conducted through the University of Nebraska, reported that PS E1 tibial bearings had an 87 percent reduction in wear over PS DCM tibial bearings (Figure 66).⁴

**E1 Antioxidant Infused Technology FDA Cleared Claims:**⁴
- Prevents oxidative degradation of polyethylene
- Protects polyethylene from oxidation and cracking during environmental stress crack testing
- Maintains the mechanical strength of conventional UHMWPE under small punch testing
- Maintains mechanical strength after accelerated aging
Polyethylene Thickness

Meding, et al. demonstrated excellent long-term results with 4.4 mm minimum thickness DCM tibial bearings. The Vanguard Complete Knee System provides a minimum of 6 mm of polyethylene thickness in all components (Figure 67).

In addition, PPS Coating has been proven to:

- Provide for more biologic fixation than CoCr material and has proven superior with regard to biocompatibility and component fit over titanium fiber mesh
- Maintain the implant’s inherent fatigue strength
- Provide early stage fixation, helping to prevent micromotion
- Provide late stage fixation, helping to offload stresses between implant and bone

Component Fixation

The Vanguard Knee system incorporates three types of fixation:
- Interlok Finish
- PPS Porous Plasma Spray Coating
- Regenerex Porous Titanium Construct

Interlok Finish

The Interlok Finish allows for proper cement interdigitation into the surface for a more secure bond in cemented applications (Figure 68).

PPS Porous Plasma Spray Coating

Since its introduction in 1981, Zimmer Biomet’s PPS Coating has been used by surgeons throughout the world to achieve better fixation on a multitude of products including the AGC, Maxim, and Ascent Knee Systems. Long-term follow-up studies show that surgeons are observing extremely low rates of osteolysis and 97 percent survivorship at 20 years with PPS coated prostheses (Figure 69).

Regenerex Porous Titanium Construct

Regenerex Porous Titanium Construct unites the proven clinical history of titanium alloy with an enhanced interconnecting pore structure, resulting in a revolutionary material that provides for biologic fixation (Figure 70).
Regenerex material provides for:

- Average porosity of 67 percent
- Average pore size of 300 microns
- High strength and flexibility
- Fixation in as early as two weeks was reported in canine studies

The large potential surface area for biologic fixation makes this tray an optimal option for patients with good bone quality.

**Tibial Tray Design Features**

Concerns have been raised about modularity and bearing micromotion as a contributor to osteolysis and early failure. Feng, et al. have found that the most severe polyethylene wear occurs at the periphery, where the tibial component had a raised metal edge. These concerns have been addressed with the Zimmer Biomet modular tibial tray design.

The modular design of the Vanguard Tibial Tray is based on clinically successful features of earlier Zimmer Biomet Total Knee Systems, including:

- Locking Mechanism
- Sizing
- Tibial Baseplate Options
- Stem Options

**Locking Mechanism**

Effective polyethylene thickness is determined by evaluating not only thickness at the center of the tibial condyle but also by measuring the periphery of the polyethylene insert. Many competitive components provide adequate thickness at the center, but compromise thickness around the edges due to the design of the locking mechanism.

Features of the locking mechanism design include (Figure 71):

- Peripheral polyethylene thickness is maintained by locating the locking mechanism anteriorly and within the intercondylar area
- Vanguard’s Locking Mechanism compresses the polyethylene bearing against the tray by utilizing an oversized titanium locking bar that forces the bearing against a 10 degree posterior boss
- The Coventry Award-winning study by Parks and Engh, and a study published by Sosa, have shown the Vanguard Locking Mechanism to be “the most stable overall.”

**Sizing**

Many knee systems offer a variety of tibial tray sizes. However, few systems offer consistent sizing. Based on the work of Mensch and Amstutz, the Vanguard Knee System offers nine symmetrical tibial baseplates that change in consistent 4 mm M/L intervals (Figure 72).
Incavo, et al. examined eight tibial tray designs, consisting of six symmetrical and two asymmetrical baseplates. The study demonstrated that the sizing rationale for the AGC Total Knee System, which is closely paralleled by the Vanguard Knee System, offers optimal coverage as compared to competitive asymmetrical designs32 (Figure 73).

Of all the tibial trays tested in one study the modular tray design of the AGC Knee was ranked as the best in total tibial plateau coverage, covering 81 percent of the tibial surface.32

Tibial Baseplate Options

Primary tibial trays are made from both titanium and cobalt chrome alloys. Modular titanium primary baseplates are available with an Interlok Finish for cemented applications, or PPS coating and Regenerex Porous Titanium Construct to enhance bone fixation in cementless applications.

PPS coated baseplates accept up to four 6.5 mm cancellous bone screws (Figure 74), while Regenerex baseplates feature four solid titanium pegs that exhibit a rough texture (Figure 75) for enhanced fixation when a cementless tibial component is utilized.

The Regenerex Tibial Tray is compatible with four primary articulations within the Vanguard Complete Knee System.

- CR
- CR Lipped
- AS
- PS

The Vanguard Complete Knee System is compatible with the following cobalt chrome baseplate options: I-beam, cruciate finned, or Microplasty tray with an Interlok Finish (Figure 76).

I-beam and cruciate finned baseplates feature a 40 mm stem design while the 20 mm cruciate stem design of the Microplasty Tibial Tray allows for a less invasive procedure and arcs posteriorly to increase resistance against pull-out.

Interlok offset tibial baseplate, Interlok stemmed baseplate, and the PPS baseplate can be used with block or wedge augments. All augments are fixed to the baseplates by bolts, allowing a mechanical lock between the tray and augments.
Stem Options
The modular titanium primary baseplate allows for intraoperative stem selection to match specific patient needs. An I-beam primary stem is available in 40 mm length, while cruciate fin and splined primary stems are available in 40 mm and 80 mm lengths. In addition to the 40 mm and 80 mm splined and cruciate fin stems, a taper cap is available for the Regenerex® Primary Tibial Tray (Figure 77).

The combination of a Morse-type taper and screw fixation helps maintain a solid connection between the stem and baseplate. When more fixation is desired, the stemmed or offset tray will accept a 40, 80, 120, 160, or 200 mm stem extension (Figure 78). Stem extensions available in splined, smooth and grit-blasted finishes. Bowed splined, smooth and grit-blasted stem extensions are offered in 160 and 180 mm lengths.

Patellar Articulation
The Vanguard Complete Knee System offers multiple patella options:
- Series A
  - Single Peg (1-Peg)
  - Three Peg (3-Peg)
- Regenerex® Construct
  - Three Peg (3-Peg)

Series A Patella
Ritter, Lombardi, Insall, Ranawat, et al. have shown excellent long-term results with domed patellar designs.9,11,33,34 The domed patella is more forgiving in placement than other designs and can reliably provide congruent contact10 (Figure 79).

Series A patellas are available in one and three peg options (Figure 80), and are available in standard thickness as well as a low profile which is on average 1.5 mm thinner than the standard patella.
Regenerex Patella

The Regenerex Primary Three Peg Patella incorporates Zimmer Biomet’s Regenerex Porous Titanium Construct with the Series A true dome shape and standard poly thickness. The octagonal pegs provide for initial fixation on the resurfaced bone (Figure 81).

Series A and Regenerex Patella size and thickness offering listed below (Figure 82).

Signature Personalized Patient Care

Signature Personalized Patient Care utilizes patient specific femoral and tibial positioning guides developed from MRI and CT imaging modality to offer an individualized approach to total knee replacement. The Signature System fits the femoral and tibial components independently. When used with the Vanguard Complete Knee System, it offers a comprehensive solution for personalized patient care. Features of the Signature System include:

- Signature Planning Landmarks
- Signature Total Knee Planning Software
- Signature Positioning Guides

Signature Planning Landmarks

The Signature System features proprietary planning algorithms to generate an initial preoperative plan incorporating traditional resection guides and allowing intraoperative position verification by the surgeon.

These landmarks include (Figure 83):

- **A** Anterior/Posterior Axis
- **B** Epicondylar Axis
- **C** Distal Femoral Mechanical Axis
- **D** Lateral Distal Femoral Condyle
- **E** Medial Distal Femoral Condyle
- **F** Posterior Condylar Axis
- **G** Lateral Plateau
- **H** Proximal Tibial Mechanical Axis Landmark
- **I** Medial Plateau
- **J** Medial One-third of the Tibial Tubercle
**Signature Total Knee Planning Software**

Software built into the Signature system allows surgeons to visualize and specify an implant position for each patient plan.

- Automated planning algorithms generate preoperative plan based off mechanical axis
- User-friendly software for surgeon fine-tuning
- Positioning guides incorporate preoperative surgeon alteration

The result of the preoperative surgical planning is a more focused intervention with the instruments required for surgery as well as the operative plan.

**Signature Positioning Guides**

Preoperative surgeon planning is integrated into Signature™ positioning guides (Figure 84).

Femoral positioning guides register on femoral bearing to establish:

- Distal femoral resection
- Distal femoral valgus angle
- Distal femoral flexion angle
- Femoral component rotation
- A/P position
- Femoral component sizing

Tibial positioning guides register on the anteromedial tibial plateau to establish:

- Tibial resection
- Varus/valgus angle
- Tibial slope angle
- Tibial rotation

**Instrumentation Platforms**

The Vanguard Complete Knee System is supported by five instrumentation platforms, allowing the physician to evaluate soft tissue and bone deficiencies intraoperatively without making a preoperative commitment to the level of constraint. These instrumentation platforms include:

- Microplasty Instrumentation
- Premier™ Instrumentation
- Microplasty Elite Instrumentation
- Vanguard Tensor Instrumentation
- Premier Anterior Referencing Instrumentation

**Microplasty Total Knee Instrumentation**

Microplasty Total Knee Instrumentation is designed for use with minimally invasive surgical techniques and includes Zimmer Biomet’s Slidex® Technology which is designed for minimal disruption to soft tissues during total knee arthroplasty (Figure 85).
Premier Total Knee Instrumentation

Premier Total Knee Instrumentation is designed for conventional total knee replacement. Enhanced instrument functionality allows for reproducible and reliable results (Figure 86).

Microplasty Elite Total Knee Instrumentation

Microplasty Elite Total Knee Instrumentation is designed for use with both traditional surgical methods as well as minimally invasive techniques. This instrumentation is designed for minimization of soft tissue trauma that occurs during total knee arthroplasty (Figure 87).

Vanguard Tensor Instrumentation

Utilizing Premier Total Knee Instrumentation, the Vanguard Tensor is designed to assist in balancing soft tissues during total knee arthroplasty (Figure 88).

Premier Anterior Referencing Instrumentation

Anterior Referencing Instrumentation is available for use with the Vanguard Complete Knee System. This instrumentation provides for anterior referencing during femoral preparation to accommodate the preferred approach of individual surgeons (Figure 89).
